Joel Ojo

Full-Stack Developer

Ibadan, Nigeria | github.com/JoelTheBigStepper

SUMMARY

Full-stack developer working across the MERN stack. I build products and client websites, from the interface to the server and database, with a focus on solving problems close to home. I care about the parts users never see: rate limits, strict JWT authentication, signed webhooks, and codebases split into small files that are easy to change.

SKILLS

Interface: React, Vite, Tailwind CSS, Framer Motion, React Router, JavaScript, TypeScript, HTML, CSS

Server: Node.js, Express, REST APIs, JWT authentication, webhooks (HMAC-SHA256), cron jobs, Nodemailer

Data: MongoDB, Mongoose, MongoDB Atlas, Redis, data scraping, fuzzy matching

AI and integrations: Claude API, Groq, Termii SMS, WebRTC, PostHog, Stripe, GS1 barcodes

Shipping: Git, GitHub, Vercel, Render, Cloudflare Workers, service workers

Also working with: Manifest V3 browser extensions, Unity and C#, Python (learning), cybersecurity (learning)

PRODUCTS

- **MedVerify**. MERN app that verifies medication authenticity against NAFDAC registration data. Multi-factor fuzzy matching engine, GS1 DataMatrix barcode scanner with a custom Application Identifier parser, verification logging, and AI explanations from Claude Haiku through a backend proxy.
- **Velastrux**. Dashboard generator SaaS on the MERN stack. Frontend calls connected sites' backends directly with a token header, so customer data never passes through Velastrux servers. Endpoint discovery (routes list, OpenAPI or Swagger, path probing), multi-step generator wizard, HMAC-SHA256 signed webhooks.
- **Synerdio**. Zero-install collaborative live web debugger built for a hackathon, using React 19, serverless WebRTC with Trystero, and Llama 3.3 70B on Groq through a Vercel serverless function.
- **Kherphi**. Manifest V3 browser extension that edits any website visually and locally. Drag, resize, insert and delete elements, per-site persistence, changes and layers panel, hardened HTML sanitizer, and a headless Chromium test harness. In development.
- **Resoary**. Internal resource library with team password authentication and PDF and snippet storage, deployed on Render and Vercel.

CLIENT WORK

- **Rhema Chapel Oluyole**. Full church website in React, Vite, Tailwind CSS and Framer Motion, with an admin workflow for the media team to publish gallery photos.
- **GLOW Concert**. One-page website with a countdown for the annual praise concert of Rhema Chapel Oluyole.
- **Glare Solutions**. Bug fixes, a new events feature, and a separate MongoDB-backed admin panel for a Lagos tech company.
- **Attendance System Rescue**. Security and reliability overhaul of a student attendance system: removed hardcoded credentials, replaced browser-only authentication, repaired queue infrastructure, and fixed timezone and schema bugs across 20 files.

CONCEPT PROJECTS

Eleven responsive concept websites built in a daily web project challenge, in React and Tailwind CSS: Forge, Luma Dental, VANTA, NorthLine, Reicus, Tend, Kairo, ARCERON, VESTIEN, Aetoir and Makeway.
